Greetings - DOM

Create a simple web page that collects students' details and greets them.

1. Add an input component for entering the student name : of type text with id "sname" and make it a mandatory field.
2. Add a dropdown component for course selection : with id "course" and option values "Python", "Java" & "Oracle". Make this selection too mandatory.
3. Add a button type component with id "submit" and value "Register".
4. Add an empty div tag with id "greet" within the paragraph tag.
5. When you click on the Register button, javascript function must get invoked & the greeting must get displayed at div (refer to the console output)
6. Handle the scenario where the student name field is left empty - by referring to the console output.

Include a function called display() inside the script.js file and display the result on the web page using .innerHTML.
Note: Include script.js in the html file. Use the same function name & component ids as mentioned in the description.
