Validate Email - Regular Expression & test Function

Write a JavaScript program to validate an email id using Regular Expression.

The function validateEmail must take an email string as its argument and return one of the following 2 statements:
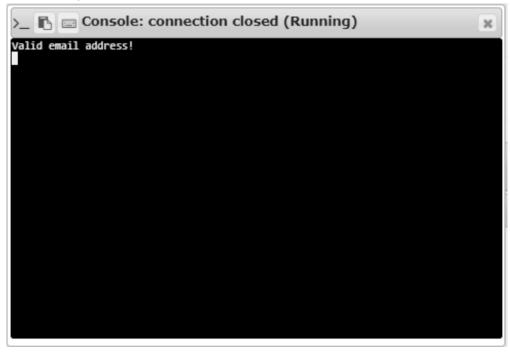

Valid email address! - when found valid &

Invalid email address! - when found invalid

Note: Refer to the function arguments within the given console.log to create a regex pattern for valid email address. You may verify the correctness of your function by invoking it from within console.log

console.log(validateEmail('info123@example.com'));

Console Output 1:

console.log(validateEmail('abc-defmail.com'));

Console Output 2:
